Other Oral Disease Risk Factors
- Tobacco and alcohol use (cancers)
- Family history of oral cancers
- Lack of mouth guard use for sports
- Methamphetamine use (erosions)
- Bulimia (erosions)
- Significant GERD (erosions)

Screening Oral Exam
Observation
- Remove all dentures and appliances
- Teeth and oral hygiene
- Palate and gums
- Buccal mucosa
- Floor of mouth & tongue (lateral borders & undersurface)
- Posterior pharynx

Palpation
- Floor of mouth
- Neck

Record
- Signs of caries
  - White spots, brown spots, pits
- Signs of periodontal disease
  - Poor oral hygiene (presence of plaque)
  - Erythematous or receded gums
  - Loose teeth
- Signs of other oral disease
  - Soft tissues lesions
  - Tooth erosion

Refer to dentist:
- All adults for 6 month check ups
- All adults with signs of caries, periodontal disease or suspicious oral lesions.

PERMANENT TOOTH CHART:

Geriatric Oral Health
Xerostomia
Signs
- Need to sip water or suck candies to talk
- Needs fluids to form food bolus when eating
- Oral burning/soreness and altered taste
- No pooling of saliva in floor of mouth
- Tongue fissured/lipstick on teeth

Etiology
- Primary disease (Sjogrens/RA/salivary tumor)
- Medications – anticholinergics, antidepressants, antipsychotics, antihypertensives, sedatives, antihistamines, inhalers

Management
- Discontinue meds or move to morning dosing
- Avoid sugar containing foods and drinks
- Xylitol mints, sugar-free gum
- Rx brush on topical fluoride gel
- Rx saliva substitutes
- Regular dental visits – higher risk for caries

Denture Care and Problems
Care
- Soak in water or denture cleaner overnight
- Rinse with water after every meal
- Brush daily with toothpaste or mild denture cleaner

Problems
- Problems with chewing, cheek biting, speech, cracked corners of mouth = poorly fitting dentures
- Erythematous candidiasis under dentures
  - Nystatin rinse 3x daily, ointment under denture
  - Soak denture in chlorhexidine or bleach/water

Antibiotic Prophylaxis Guidelines for Oral Procedures
At Risk Medical Conditions
Highest Risk
- Prosthetic cardiac valves
- Previous bacterial endocarditis
- Congenital heart disease (CHD)
  - Unrepaired cyanotic CHD
  - Completely repaired congenital heart defect during the first 6 months after the procedure
- Repaired CHD with residual defects
- Cardiac transplantation recipients who develop cardiac valvulopathy

Lower Risk - No longer prophylaxed
- Acquired valvular dysfunction
- Hypertrophic cardiomyopathy
- Mitral valve prolapse with audible regurgitation
- Isolated secundum atrial septal defect
- Previous coronary artery bypass grafting
- Physiologic, functional, or innocent murmurs
- Previous Kawasaki disease w/o valve dysfunction
- Cardiac pacemaker or implanted defibrillator
Prophylaxis also recommended for patients with the following implanted medical devices:

- Total joint replacement
  - In place less than 2 years
  - Immunocompromised patient
  - Previous prosthetic joint infection
- Vascular grafts in place less than 6 months
- Arteriovenous shunt for hemodialysis
- Neurosurgical shunts
- Indwelling catheters

Planned Procedure

Prophylaxis recommended for highest risk patients for:

- All dental procedures that involve manipulation of gingival tissue or the periapical region of teeth or perforation of the oral mucosa

Prophylaxis NOT recommended for:

- Local anesthetic injections through non-infected tissue
- Removable appliance placement
- Oral radiographs
- Orthodontic appliance adjustment
- Shedding of primary teeth
- Bleeding from trauma to the lips and oral mucosa

Antibiotic choices

Standard prophylaxis (give 1 dose only orally 30 – 60 minutes before procedure):
- Amoxicillin: Adults: 2.0 g; children: 50 mg/kg
- Cephalexin: Adults: 2.0 g; children: 50 mg/kg (caution if hypersensitivity to penicillins)
- Azithromycin or clarithromycin: Adults: 500 mg; children: 15 mg/kg

**Allergic to penicillin (give orally 1 dose only 30 – 60 minutes before procedure):**
- Clindamycin: Adults: 600 mg; children: 20 mg/kg
- Cefazolin or Ceftriaxone: Adults: 1.0 g; children: 50 mg/kg

**ANTICOAGULATION GUIDELINES FOR ORAL PROCEDURES**

- Cessation of anticoagulation or anti-platelet agents carries a small but real chance of thromboembolic event
- Cleanings, fillings, and simple extractions can be performed without interrupting anticoagulation
- Bleeding can be controlled with tranexamic acid or epsilon amino caproic acid mouthwash (discuss with dentist/oral surgeon; costly)
- Patients that are at high risk for thromboembolic events that need to undergo oral procedures that are high risk for bleeding can be managed with “bridge therapy” using enoxaparin (Lovenox) and/or heparin days before the procedure
- Communication with dentist is vital

**IMPORTANT NOTICE:**
The “Antibiotic Prophylaxis Guidelines” above are based on the latest recommendations by the American Heart Association (updated 2007).
It is advised to consult the American Heart Association website for more details and for any updates: www.americanheart.org

**ADULT ORAL HEALTH POCKET CARD**

Hugh Silk MD, Alan Douglass MD, Joanna Douglass BDS
A product of the STFM Group on Oral Health
www.stfm.org/oralhealth June 2007

Creation of this product was funded by:
The Health Foundation of Central Massachusetts, University of Massachusetts Medical School, and Central Massachusetts Oral Health Initiative.

The information contained in this card should not substitute for consultation with an oral health expert.

**PRIMARY CARE**

Prevention of Caries & Periodontal Disease

- Eliminate sweet snacks/drinks between meals
- Brush twice daily with fluoridated toothpaste
- Floss daily
- Regular dental visits every 6 months
- Regular oral exam at annual medical exam

Caries Risk Factors

- Presence of cavities or multiple fillings
- Gingival recession
- Xerostomia (medications, disease)
- Poor oral hygiene
- Poor access to dental care
- Low socio-economic and/or education status
- Inadequate fluoride
- High frequency foods/drinks/medications with sugar
- Special health care needs (oral health often overlooked)
- Presence of partial dentures or other appliances

Periodontal Disease Risk Factors

- Poor oral hygiene
- Tobacco use
- Diabetes
- Osteoporosis
- Medications (anticonvulsants, methotrexate, Ca\(^{++}\) channel blockers may cause gingival hyperlasia)
